

# Using Standard Deployment for your Uniface Applications

Author: Michel van den Berg, Uniface Software Architect

Deploying your Uniface applications with standard deployment is a methodology that can perhaps make your life easier. With the classic style of deployment, rolling out your application is not always that straight forward. The following graphic shows this, .dol and .urr files are shared over the components, making it difficult to structure.

## Classical Style

With Uniface Standard Deployment, the runtime environment will be different, all objects are delivered in single or a small set of archives. This of course brings many benefits, such as easier application distribution, updates and partitioning. No more .dol's or .urr's files getting mixed together over applications.

## Standard Deployment Style

To help you get started with using Standard Deployment for your Uniface applications, join this online seminar that will show you the overview of the functionality so you can learn how to move from classic to standardized deployment style.

[Registration is open](#), hope to see you there on January 7<sup>th</sup>.
